## Articles to Read in Other Journals

### Risk of Uterine Perforation Among Users of Intrauterine Devices

Heartwell SF, Schlesselman S

*Obstetrics & Gynecology*  
61:31-36, Jan 1983

DISCIPLINES: Family Practice, Obstetrics, Gynecology, Planned Parenthood, Public Health

READABILITY: Very good

*In this collaborative Women's Health Study the authors concluded that when an intrauterine device of any type was inserted into the uterus of a lactating mother, perforation was ten times as frequent as when this was done in nonlactating women. The reason: low estrogen endometrium and increased uterine contractility.*
